KarnatakaDBT external data requirements

Department coordination brief | Built by Sathvick | 16 October 2026

Use this brief to request access to the minimum data needed for a KarnatakaDBT pilot. Start with household verification and one scheme. The fields below are proposed requirements, subject to the scheme rules and the data owner's approval; they are not a confirmed API schema.

Core data to request

System and owner to approach	Minimum data requested	Use in KarnatakaDBT
Kutumba Centre for e Governance	Family and member references; names; relationships; date of birth or age; address and location codes; permitted verified attributes and source timestamps	Match households and members; prefill records; compare eligibility evidence
AHARA Food Civil Supplies and Consumer Affairs	Ration card reference and category; active status; linked members; location; last update	Check food security category and household membership where scheme rules require it
Nadakacheri AJSK Revenue Department	Certificate reference and type; income or category result where required; issue and validity dates; verification status	Validate income, residence or caste certificates only for applicable scheme conditions
Scheme department Programme owner	Scheme code; rule version; eligibility thresholds; sanctioned beneficiary reference; benefit amount; approval and existing benefit status	Configure the programme and prevent duplicate benefits within approved scope

Prefer a permitted verification result over a full record when that is sufficient. Request Kutumba first and add direct departmental checks only for fields or freshness it cannot supply.

Additional data by scheme

Connect these sources only when the selected scheme needs them. Confirm the responsible business owner and technical custodian during onboarding.

System and owner to approach	Minimum data requested	Use in KarnatakaDBT
FRUITS Agriculture and allied departments	Farmer reference; registration status; scheme relevant crop, season or land linkage; update date	Farmer eligibility and permitted benefit overlap checks
Bhoomi Revenue Department	Land record reference; survey and village codes; extent; ownership or mutation status; effective date	Land based eligibility when explicitly required
eJanMa Birth and death registration authorities	Birth or death event verification; registration reference; event date; matched person reference	Verify age or life event; route discrepancies for review
SSP and education systems Scholarship and education departments	Student reference; enrolment and institution; academic year; course; scholarship sanction and payment status	Student eligibility and scholarship overlap checks
Seva Sindhu Service owning department and platform team	Application reference; service code; stage; decision; correction request; timestamp	Link service applications and avoid repeated submission
Official state DBT and authorised treasury or bank route CeG DBT team and Finance or Treasury	Beneficiary and scheme references; permitted financial address validation result; instruction reference; amount; settlement status; failure reason; reconciliation reference	Validate payment readiness and reconcile outcomes through the approved route
LGD and state location masters Panchayati Raj and relevant state custodians	District, subdistrict, village and urban body codes; names; effective dates and change history	Maintain consistent geography and code crosswalks

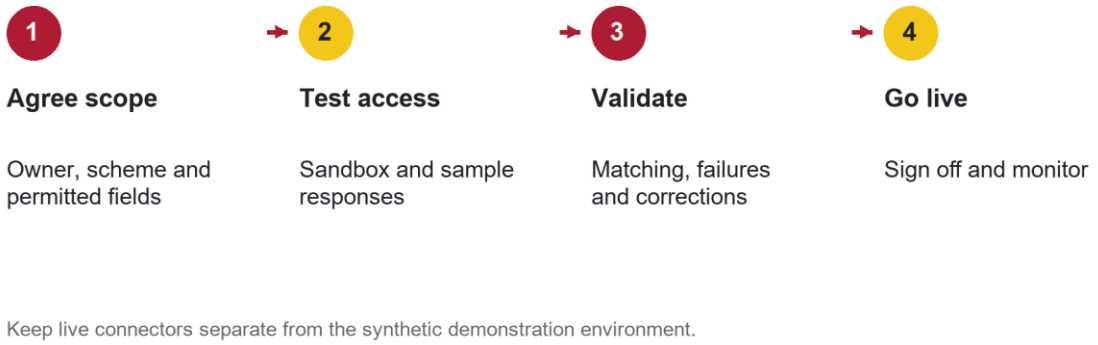

Identity and document verification

DigiLocker or API Setu can provide an approved route to participating issuers' documents. Aadhaar authentication requires the applicable authorised UIDAI ecosystem route. Do not request biometrics or assume unrestricted Aadhaar, bank or government database access.

Latitude and longitude: collect from the beneficiary or authorised field staff with source and verification status. A household address or district code does not establish an exact GPS location.

What to request from each server team

Request an approved service interface rather than direct database credentials. The source owner must supply actual server addresses and network requirements; public websites are not production API endpoints.

Request package	Details to obtain
Business approval	Sponsoring department; permitted purpose and fields; data sharing approval; retention and correction responsibilities
Server and security	Separate test and production API base URLs; API owner; VPN or IP allowlist requirements; authentication method; certificates and credential rotation
API contract	Request and response schema; identifier rules; code masters; timestamps; version; error codes; rate limits and approved refresh schedule
Operations	Sandbox credentials delivered securely; synthetic test cases; timeout and retry policy; duplicate prevention keys; outage contact and service expectations
Evidence and payment audit	Source and record reference; fetched and effective times; match result; evidence status; decision reference; payment reconciliation and failure handling

Do not equate an unavailable source with ineligibility. Keep unavailable, no match, mismatch and verified results distinct, and provide an authorised correction or review route.

Recommended first request

Ask the sponsoring scheme department and CeG Kutumba team for a sandbox household verification interface, permitted member attributes and the current contract. Add one certificate verification source. Keep payments simulated until financial onboarding and reconciliation tests are approved.
